

Release Notes 2026.7.1

This release includes targeted improvements across Clinical and platform access to strengthen reliability, accuracy, and the overall user experience.

Updates improve **evaluation printing**, preserve **vital sign documentation when services are rescheduled**, ensure **Prospect visibility reflects each community's configuration**, and provide **more reliable sign-in for users who work across many communities**.

Together, these improvements reduce workflow interruptions and help ensure teams have consistent access to the information and functionality they need.

Fixes

- **Evaluation printing: subquestion answers now included** — When printing an evaluation, subquestions and additional prompt details are now printed for the answers that were actually selected. Previously, subquestions for unselected answers printed and the selected ones were omitted, so completed details (e.g., on the Skin Assessment) were missing from the printout.
- **Rescheduled services retain vital signs** — Rescheduling a missed service that includes vital signs now carries the vital signs forward, so staff can document them on the rescheduled service. Previously the vitals fields were unavailable after rescheduling.
- **Prospects visibility in Clinical now controlled per community** — This corrects cases where users with access to multiple communities saw Prospects at communities without CRM, and community/clinical managers could not see it where they should.
- **Login failure for users with access to many communities** — Users assigned to a large number of communities (roughly 30+) could not log in; the sign-in attempt would spin and return to the login screen due to an oversized security context on the request. These users can now log in normally, and the temporary org-admin workaround is no longer needed.
